## Java JButton

The JButton class is used to create a labeled button that has platform independent implementation. The application result in some action when the button is pushed. It inherits AbstractButton class.

### JButton class declaration

Let's see the declaration for javax.swing.JButton class.

1. **public class** JButton **extends** AbstractButton **implements** Accessible

### Commonly used Constructors:

| Constructor       | Description   |
|-------------------|---|
| JButton()         | It creates a button with no text and icon.          |
| JButton(String s) | It creates a button with the specified text.        |
| JButton(Icon i)   | It creates a button with the specified icon object. |

## Commonly used Methods of AbstractButton class:

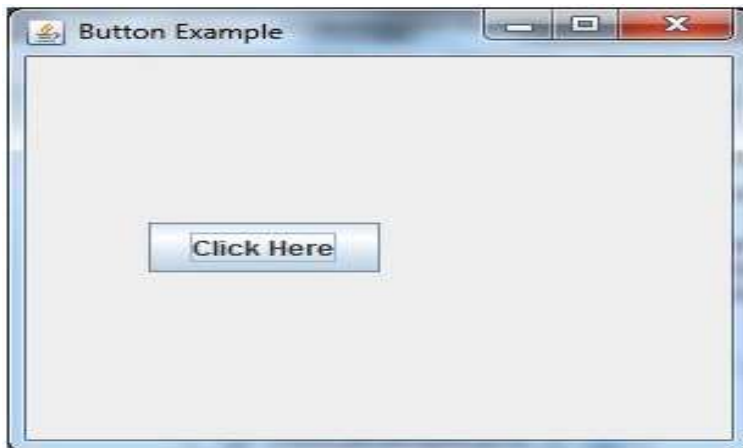

| Methods                                  | Description  |
|--|--|
| void setText(String s)                   | It is used to set specified text on button                   |
| String getText()                         | It is used to return the text of the button.                 |
| void setEnabled(boolean b)               | It is used to enable or disable the button.                  |
| void setIcon(Icon b)                     | It is used to set the specified Icon on the button.          |
| Icon getIcon()                           | It is used to get the Icon of the button.                    |
| void setMnemonic(int a)                  | It is used to set the mnemonic on the button.                |
| void addActionListener(ActionListener a) | It is used to add the <b>action listener</b> to this object. |

## Java JButton Example

1. **import** javax.swing.\*;
2. **public class** ButtonExample {
3. **public static void** main(String[] args) {
4.   JFrame f=**new** JFrame("Button Example");
5.   JButton b=**new** JButton("Click Here");
6.   b.setBounds(50,100,95,30);
7.   f.add(b);

```
8. f.setSize(400,400);
9. f.setLayout(null);
10. f.setVisible(true);
11.} }
```

Output:

### Java JButton Example with ActionListener

```
1. import java.awt.event.*;
2. import javax.swing.*;
3. public class ButtonExample {
4.     public static void main(String[] args) {
5.         JFrame f=new JFrame("Button Example");
6.         final JTextField tf=new JTextField();
7.         tf.setBounds(50,50, 150,20);
8.         JButton b=new JButton("Click Here");
9.         b.setBounds(50,100,95,30);
10.        b.addActionListener(new ActionListener(){
11.            public void actionPerformed(ActionEvent e){
```

```
12.      tf.setText("Welcome to Javatpoint.");
13.    }
14.  });
15.  f.add(b);f.add(tf);
16.  f.setSize(400,400);
17.  f.setLayout(null);
18.  f.setVisible(true);
19.} }
```

Output:

### Example of displaying image on the button:

```
1. import javax.swing.*;
2. public class ButtonExample{
3. ButtonExample(){
4. JFrame f=new JFrame("Button Example");
5. JButton b=new JButton(new ImageIcon("D:\\icon.png"));
6. b.setBounds(100,100,100, 40);
7. f.add(b);
8. f.setSize(300,400);
9. f.setLayout(null);
10.f.setVisible(true);
11.f.setDefaultCloseOperation(JFrame.EXIT_ON_CLOSE);
12. }
13.public static void main(String[] args) {
14. new ButtonExample();
15.} }
```

Output:

## Java JLabel

The object of JLabel class is a component for placing text in a container. It is used to display a single line of read only text. The text can be changed by an application but a user cannot edit it directly. It inherits JComponent class.

### JLabel class declaration

Let's see the declaration for javax.swing.JLabel class.

1. **public class** JLabel **extends** JComponent **implements** SwingConstants, Accessible

### Commonly used Constructors:

| Constructor                                       | Description   |
|---|---|
| JLabel()  | Creates a JLabel instance with no image and with an empty string for the title.     |
| JLabel(String s)                                  | Creates a JLabel instance with the specified text.                                  |
| JLabel(Icon i)                                    | Creates a JLabel instance with the specified image.                                 |
| JLabel(String s, Icon i, int horizontalAlignment) | Creates a JLabel instance with the specified text, image, and horizontal alignment. |

## Commonly used Methods:

| Methods                                    | Description  |
|--|--|
| String getText()                           | It returns the text string that a label displays.                  |
| void setText(String text)                  | It defines the single line of text this component will display.    |
| void setHorizontalAlignment(int alignment) | It sets the alignment of the label's contents along the X axis.    |
| Icon getIcon()                             | It returns the graphic image that the label displays.              |
| int getHorizontalAlignment()               | It returns the alignment of the label's contents along the X axis. |

## Java JLabel Example

```
1. import javax.swing.*;
2. class LabelExample
3. {
4.     public static void main(String args[])
5.     {
6.         JFrame f= new JFrame("Label Example");
7.         JLabel l1,l2;
8.         l1=new JLabel("First Label.");
9.         l1.setBounds(50,50, 100,30);
```

```

10. l2=new JLabel("Second Label.");
11. l2.setBounds(50,100, 100,30);
12. f.add(l1); f.add(l2);
13. f.setSize(300,300);
14. f.setLayout(null);
15. f.setVisible(true);
16. } }

```

**Output:**

### Java JLabel Example with ActionListener

```

1. import javax.swing.*;
2. import java.awt.*;
3. import java.awt.event.*;
4. public class LabelExample extends Frame implements ActionListener{
5.     JTextField tf; JLabel l; JButton b;
6.     LabelExample(){
7.         tf=new JTextField();
8.         tf.setBounds(50,50, 150,20);
9.         l=new JLabel();
10.        l.setBounds(50,100, 250,20);

```

```
11.    b=new JButton("Find IP");
12.    b.setBounds(50,150,95,30);
13.    b.addActionListener(this);
14.    add(b);add(tf);add(l);
15.    setSize(400,400);
16.    setLayout(null);
17.    setVisible(true);
18. }
19. public void actionPerformed(ActionEvent e) {
20.     try{
21.         String host=tf.getText();
22.         String ip=java.net.InetAddress.getByName(host).getHostAddress();
23.         l.setText("IP of "+host+" is: "+ip);
24.     }catch(Exception ex){System.out.println(ex);}
25. }
26. public static void main(String[] args) {
27.     new LabelExample();
28. } }
```

### Output:

## Java JTextField

The object of a JTextField class is a text component that allows the editing of a single line text. It inherits JTextComponent class.

### JTextField class declaration

Let's see the declaration for javax.swing.JTextField class.

1. **public class** JTextField **extends** JTextComponent **implements** SwingConstants

### Commonly used Constructors:

| Constructor                          | Description  |
|--------------------------------------|--|
| JTextField()                         | Creates a new TextField  |
| JTextField(String text)              | Creates a new TextField initialized with the specified text.             |
| JTextField(String text, int columns) | Creates a new TextField initialized with the specified text and columns. |
| JTextField(int columns)              | Creates a new empty TextField with the specified number of columns.      |

## Commonly used Methods:

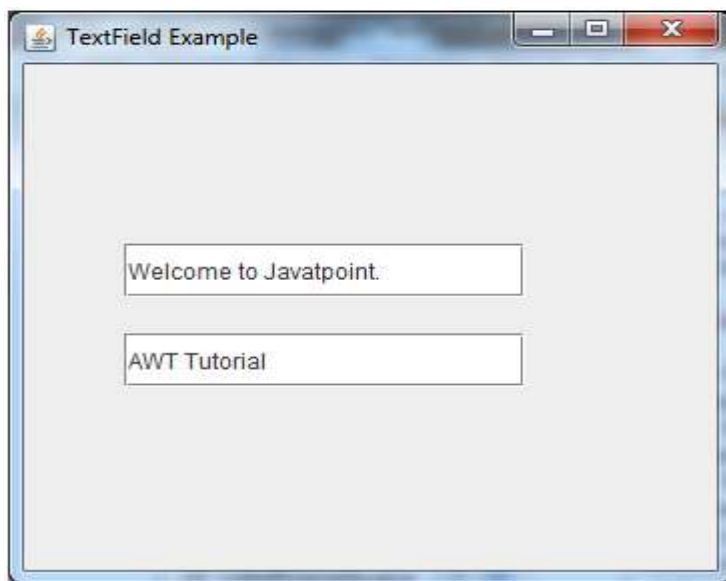

| Methods  | Description   |
|--|---|
| <code>void addActionListener(ActionListener l)</code>    | It is used to add the specified action listener to receive action events from this textfield.                       |
| <code>Action getAction()</code>                          | It returns the currently set Action for this ActionEvent source, or null if no Action is set.                       |
| <code>void setFont(Font f)</code>                        | It is used to set the current font.   |
| <code>void removeActionListener(ActionListener l)</code> | It is used to remove the specified action listener so that it no longer receives action events from this textfield. |

## Java JTextField Example

```
1. import javax.swing.*;  
2. class TextFieldExample  
3. {  
4.     public static void main(String args[])  
5.     {  
6.         JFrame f= new JFrame("TextField Example");  
7.         JTextField t1,t2;  
8.         t1=new JTextField("Welcome to Javatpoint.");  
9.         t1.setBounds(50,100, 200,30);
```

10. `t2=new JTextField("AWT Tutorial");`
11. `t2.setBounds(50,150, 200,30);`
12. `f.add(t1); f.add(t2);`
13. `f.setSize(400,400);`
14. `f.setLayout(null);`
15. `f.setVisible(true);`
16. `}`
17. `}`

Output:

## Java JTextField Example with ActionListener

```
1. import javax.swing.*;
2. import java.awt.event.*;
3. public class TextFieldExample implements ActionListener{
4.     JTextField tf1,tf2,tf3;
5.     JButton b1,b2;
6.     TextFieldExample(){
7.         JFrame f= new JFrame();
8.         tf1=new JTextField();
9.         tf1.setBounds(50,50,150,20);
10.        tf2=new JTextField();
11.        tf2.setBounds(50,100,150,20);
12.        tf3=new JTextField();
13.        tf3.setBounds(50,150,150,20);
14.        tf3.setEditable(false);
15.        b1=new JButton("+");
16.        b1.setBounds(50,200,50,50);
17.        b2=new JButton("-");
18.        b2.setBounds(120,200,50,50);
19.        b1.addActionListener(this);
20.        b2.addActionListener(this);
21.        f.add(tf1);f.add(tf2);f.add(tf3);f.add(b1);f.add(b2);
22.        f.setSize(300,300);
23.        f.setLayout(null);
24.        f.setVisible(true);
25.    }
```

```
26. public void actionPerformed(ActionEvent e) {
27.     String s1=tf1.getText();
28.     String s2=tf2.getText();
29.     int a=Integer.parseInt(s1);
30.     int b=Integer.parseInt(s2);
31.     int c=0;
32.     if(e.getSource()==b1){
33.         c=a+b;
34.     }else if(e.getSource()==b2){
35.         c=a-b;
36.     }
37.     String result=String.valueOf(c);
38.     tf3.setText(result);
39. }
40. public static void main(String[] args) {
41.     new TextFieldExample();
42. }
```

**Output:**

## Java JTextArea

The object of a JTextArea class is a multi line region that displays text. It allows the editing of multiple line text. It inherits JTextComponent class

### JTextArea class declaration

Let's see the declaration for javax.swing.JTextArea class.

1. **public class** JTextArea **extends** JTextComponent

### Commonly used Constructors:

| Constructor                              | Description  |
|--|--|
| JTextArea()                              | Creates a text area that displays no text initially.   |
| JTextArea(String s)                      | Creates a text area that displays specified text initially.  |
| JTextArea(int row, int column)           | Creates a text area with the specified number of rows and columns that displays no text initially. |
| JTextArea(String s, int row, int column) | Creates a text area with the specified number of rows and columns that displays specified text.    |

## Commonly used Methods:

| Methods  | Description  |
|--|--|
| <code>void setRows(int rows)</code>              | It is used to set specified number of rows.                        |
| <code>void setColumns(int cols)</code>           | It is used to set specified number of columns.                     |
| <code>void setFont(Font f)</code>                | It is used to set the specified font.                              |
| <code>void insert(String s, int position)</code> | It is used to insert the specified text on the specified position. |
| <code>void append(String s)</code>               | It is used to append the given text to the end of the document.    |

## Java JTextArea Example

```
1. import javax.swing.*;  
2. public class TextAreaExample  
3. {  
4.     TextAreaExample(){  
5.         JFrame f= new JFrame();  
6.         JTextArea area=new JTextArea("Welcome to javatpoint");  
7.         area.setBounds(10,30, 200,200);  
8.         f.add(area);  
9.         f.setSize(300,300);  
10.        f.setLayout(null);  
11.        f.setVisible(true);
```

```
12.  }
13. public static void main(String args[])
14.  {
15.    new TextAreaExample();
16.  }}
```

**Output:**

### **Java JTextArea Example with ActionListener**

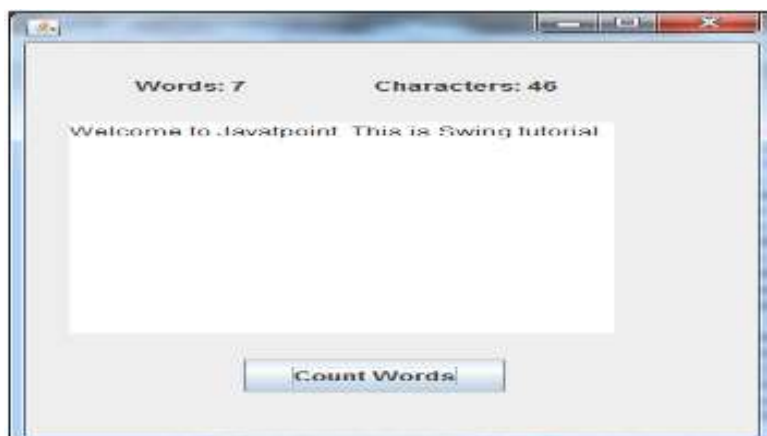

```
1. import javax.swing.*;
2. import java.awt.event.*;
3. public class TextAreaExample implements ActionListener{
4.    JLabel l1,l2;
5.    JTextArea area;
6.    JButton b;
7.    TextAreaExample() {
8.        JFrame f= new JFrame();
9.        l1=new JLabel();
10.       l1.setBounds(50,25,100,30);
11.       l2=new JLabel();
12.       l2.setBounds(160,25,100,30);
```

```

13. area=new JTextArea();
14. area.setBounds(20,75,250,200);
15. b=new JButton("Count Words");
16. b.setBounds(100,300,120,30);
17. b.addActionListener(this);
18. f.add(l1);f.add(l2);f.add(area);f.add(b);
19. f.setSize(450,450);
20. f.setLayout(null);
21. f.setVisible(true);
22.}
23.public void actionPerformed(ActionEvent e){
24. String text=area.getText();
25. String words[]=text.split("\\s");
26. l1.setText("Words: "+words.length);
27. l2.setText("Characters: "+text.length());
28.}
29.public static void main(String[] args) {
30. new TextAreaExample();
31.} }

```

### Output:

## Java JPasswordField

The object of a JPasswordField class is a text component specialized for password entry. It allows the editing of a single line of text. It inherits JTextField class.

### JPasswordField class declaration

Let's see the declaration for javax.swing.JPasswordField class.

1. **public class** JPasswordField **extends** JTextField

### Commonly used Constructors:

| Constructor                              | Description  |
|--|--|
| JPasswordField()                         | Constructs a new JPasswordField, with a default document, null starting text string, and 0 column width. |
| JPasswordField(int columns)              | Constructs a new empty JPasswordField with the specified number of columns.                              |
| JPasswordField(String text)              | Constructs a new JPasswordField initialized with the specified text.                                     |
| JPasswordField(String text, int columns) | Construct a new JPasswordField initialized with the specified text and columns.                          |

## Java JPasswordField Example

```
1. import javax.swing.*;
2. public class PasswordFieldExample {
3.     public static void main(String[] args) {
4.         JFrame f=new JFrame("Password Field Example");
5.         JPasswordField value = new JPasswordField();
6.         JLabel l1=new JLabel("Password:");
7.         l1.setBounds(20,100, 80,30);
8.         value.setBounds(100,100,100,30);
9.         f.add(value); f.add(l1);
10.        f.setSize(300,300);
11.        f.setLayout(null);
12.        f.setVisible(true);
13.    }
14.}
```

Output:

## Java JPasswordField Example with ActionListener

```
1. import javax.swing.*;
2. import java.awt.event.*;
3. public class PasswordFieldExample {
4.     public static void main(String[] args) {
5.         JFrame f=new JFrame("Password Field Example");
6.         final JLabel label = new JLabel();
7.         label.setBounds(20,150, 200,50);
8.         final JPasswordField value = new JPasswordField();
9.         value.setBounds(100,75,100,30);
10.        JLabel l1=new JLabel("Username:");
11.        l1.setBounds(20,20, 80,30);
12.        JLabel l2=new JLabel("Password:");
13.        l2.setBounds(20,75, 80,30);
14.        JButton b = new JButton("Login");
15.        b.setBounds(100,120, 80,30);
16.        final JTextField text = new JTextField();
17.        text.setBounds(100,20, 100,30);
18.        f.add(value); f.add(l1); f.add(label); f.add(l2); f.add(b); f.add(text)
19.        f.setSize(300,300);
20.        f.setLayout(null);
21.        f.setVisible(true);
22.        b.addActionListener(new ActionListener() {
23.            public void actionPerformed(ActionEvent e) {
24.                String data = "Username " + text.getText();
25.                data += ", Password: "
```

```
26.         + new String(value.getPassword());
27.         label.setText(data);
28.     }
29. });
30.}
31.}
```

Output:
